Context & Motivation

- Say what I do and why

LLE Solvability

- Say that the problem is harder than pathfinding
- Talk a bit about complexity
- Show options to make solver

Background: Satisfiability Problem

Definition (SAT)

Given a Boolean formula ϕ over variables $x_1, ..., x_n$, decide whether there exists an assignment $\alpha : \{x_1, ..., x_n\} \to \{0, 1\}$ such that $\phi(\alpha) = \top$.

Definition (CNF)

A formula is in conjunctive normal form if it is a conjunction of one or more clauses, where a clause is a disjunction of literals

$$F = \bigwedge_{i=1}^{m} \left(\bigvee_{j=1}^{k_i} l_{i,j} \right)$$

Theorem (Cook–Levin)

SAT is NP-complete.

Solver

- Find a reduction (a way to transform a LLE solvability instance into a SAT instance)

Variables

- $a_{c,x,y,t}$: agent with color c at position (x, y) after t time steps
- $b_{c,d,x,y,t}$: beam of color c with direction d at position (x, y) after t time steps
- $l_{c,x,y,t}$: laser of color c active at position (x, y) after t time steps

Constraints

- Initializations : starting tiles and laser sources
- Movements : legal movements, unique position, no overlap and exit tiles
- Lasers : beam propagation
